

ANEMOS

Brand guidelines

Plan less. Travel more.

The brand in one page

Anemos — άνεμος, Greek for *wind*, the thing every journey rides on — is an AI travel companion: describe the trip you want and get a full day-by-day itinerary with routes, places, and flights.

The mark is an eight-point wind rose off a portolan chart: long cardinal points in the brand's deep teal, short intercardinal points in heritage gold, each point split into a light left half and a dark right half. It replaced the horse-in-horseshoe mark that retired with the Golden Tempo name; the chat persona **Ferdinand** keeps the equine nod.

The brand voice of the product is Aegean and editorial — engraved serif headings, deep sea-teal, real photography — while the interface underneath stays calm, modern, and utilitarian.

Product name

Anemos (wordmark renders as full-caps ANEMOS — the caps come from the string, not the face)

Market position & the teal verdict

Before codifying the palette, we asked whether teal is the right ground at all. The competitive field (surveyed on Mobbin, August 2026, across trip-planner home screens, AI travel chat, and onboarding) splits into three clusters.

Competitor swatches are observed from screen captures and approximate — they are reference points, not tokens. App names link to representative Mobbin screens.

The blue wall

OTAs and airlines. Trust-blue is the category default — and therefore generic. Wearing blue means looking like everyone's booking engine.

Every one of these leads with a saturated blue on white. The cluster owns "transactional trust" — and none of it is distinctive.

The warm editorial set

The newest AI-first planners. Cream and sand surfaces, serif display type, photography doing the emotional work. This is where premium is moving.

No strong brand hue at all — the identity is the paper, the serif, and the photograph. Confident, but easily anonymous without a color to own.

The warm-accent indies

Indie trip planners differentiating with a single hot accent on neutral ground.

Orange and crimson dominate. The only teal-adjacent players anywhere in the field: [Viator](#) (tour marketplace, emerald ≈ #328764) and [IHG's concierge](#) (hotel loyalty, slate teal). Neither is a trip planner.

Verdict: teal stays.

Deep sea-teal is the right ground for Anemos, and nobody in the AI-planner space owns it. It sits adjacent to travel-trust blue without dissolving into the blue wall; it reads Aegean — the sea the wind rose was drawn for — which the name, the mark, and the Greece-first features all reinforce; and it carries the calm, capable tone an agent that books real trips needs.

The refinement, not the replacement: lean into the warm ground. Keep teal as identity and action; let surfaces read like sun-bleached plaster (paper, sand, cream — the ground this document itself stands on) and let photography carry the heat. The house design direction already names this target — the market only confirms it: teal on warm paper is a combination none of the three clusters occupies.

Logo

One mark, two cuts, one policy: **the rose always floats bare.**

Anatomy

- ● **Cardinal points** — long, in brand teal. Each point splits light-left / dark-right, classic portolan-chart shading.
- ● **Intercardinal points** — short, in heritage gold. Gold lives in the mark and nowhere else.
- **Hub** — white dot with a teal-900 ring.

Source of truth — `docs/branding/mark.svg` . Every raster is generated by `scripts/brand-render.sh` ; edit the SVGs, never the PNGs. A geometry change in `mark.svg` must be mirrored in `mark-light.svg` .

The two cuts

The only question a surface may ask is *which cut it needs* — never whether to add a plate.

Dark cut — `mark.svg`

Aegean page surfaces and scrimmed imagery: auth screen, nav rail, favicon.

Light cut — `mark-light.svg`

Dark brand fields — the boot splash (flat Aegean night since v1.7), where the dark cut's azure bezel would sink. (The app bar left the gradient for neutral surface in v1.4 and takes the dark cut.)

Plate policy, v3 — the rose always floats bare. No plate is drawn anywhere in the app. v2 kept a white plate on gradient app bars; because that gradient never changes with theme, the plate stayed white in dark mode and became the brightest object on screen. Exactly three artifacts outside the app keep a baked plate on purpose: `web/og-card.png` (lands on arbitrary social backgrounds), `web/icons/Icon-maskable-512.png` (the maskable spec requires an opaque field), and the print packet header. The policy lives in `lib/widgets/brand_logo.dart` — re-litigate it there, not at a call site.

Wordmark

The wordmark is **live text, never an image**: Cormorant Garamond SemiBold (a static w600 instance, subsetting). The face *has* a true lowercase, so the caps come from the string — `AppInfo.name.toUpperCase()` in `BrandWordmark`, never from `text-transform` alone. Tracking opens as size grows — caps run wide, and each surface was measured separately.

ANEMOS

Display specimen at 40 px. Shipped surfaces: auth screen 26 px / letter-spacing 1.5; the boot splash (web shell and in-app) is the tuned outlier at 22 px / 3.0. Held in reserve: if a wordmark ever returns to photography, it goes white with a black-26 shadow (blur 8, offset 0,2).

ANEMOS

App bar · 19 px · letter-spacing 1.0 · inherits the bar's white foreground

Clear space & minimum sizes

Clear space: keep at least 25% of the mark's height free on every side (the dashed frame). Nothing enters it — not the wordmark's descenders, not badge counts, not card edges.

Sizes in product: 48 px standard in chrome (app bar, nav rail) · 28 px default (`BrandLogo.mark`) · 72 px auth screen · 128 px boot splash · legible down to 16 px (the favicon is the floor). The signed-out landing page deliberately carries no in-page mark — its app bar is the one brand carrier.

Box size vs. optical size: every number above is the mark's *box*, and the box is bigger than the drawing. `mark.svg`'s ink is **94.2%** of its square artboard, and `BrandLogo.mark` renders `Image.asset(height: size, fit: BoxFit.contain)` against that square, so a *size* of *n* paints **0.942 n**. 48 px in chrome paints 45; 128 px on the splash paints 121; 72 px on auth paints 68. Size a new surface against the mark you want to see, then divide by 0.942.

Never port a box size across marks. The bare Waypoint Thread rose that shipped before this one (`mark-thread-backup.svg`) sat on a 540×540 canvas holding art measuring 515×410 — only **75.9%** of its height, with 65 px of transparent padding baked in top and bottom — so its numbers mean something else entirely: 36 painted 27, 44 painted 33, and it was pushed to 58 to paint 44. Under this mark 58 would paint 55 into a 56 px bar. A box size lifted from that era, or from git history, is a third off.

Never

- ⊗ No plates. The rose floats bare on every in-app surface — pick the right cut instead.

- ⊗ Never the dark cut on a teal field — it reads teal-on-teal. Teal fields take mark-light.

- ⊗ Never recolor. Teal cardinals, gold intercardinals — the two cuts are the only palettes.

ANEMOS

anemos_mark.png
anemos_logo.png
og-card.png

⊗ Never stretch, rotate, or redraw. The mark renders square, upright, from the source SVGs.

⊗ Never fake the wordmark — no substitute faces, no synthesized bold. Cormorant Garamond SemiBold or nothing. (This demo names Georgia outright: the display face is now the wordmark's own family, so `--serif` would no longer show a substitute at all.)

⊗ Never hand-edit rendered PNGs, and never load `lockup.svg` as a plain image — every raster comes from `scripts/brand-render.sh`.

Color

The teal family is the spine of the app: the entire Material 3 scheme is seeded from `AppColors.brand`. Every value below is a token in `lib/theme/app_colors.dart` unless noted.

Brand ramp

brandTint #E0F2F1 teal 50 · selected fills	teal 100 #B2DFDB mark-light cardinals	brandLight #00897B gradient start	brand #00796B the seed · primary	platform #00695C button hover	brandDark #004D40 wordmark ink · scrims
--	---	--	--	--	---

Tokens resolve to Material teal shades 50 / 100 / 600 / 700 / 800 / 900. The shell's splash field is Aegean night `#0C1F2C` — it lives in `web/index.html`, `manifest.json`, and the native splash config rather than Dart (v1.7: the splash left the teal gradient for the app's dark page field).

The gradient & its scrims

<code>brandGradient</code> · top-left → bottom-right · <code>#00897B</code> → <code>#004D40</code> · signed-out photo/guide panels only —	unsanctioned as a brand surface in v1.4	(the de-gradient pass): chrome and hero cards are neutral; the boot splash left it for flat Aegean night in v1.7; phase 2 flattens the remaining signed-out fields
---	--	--

heroScrim

brandDark 88% → 35%,
bottom-left → top-right.
Darkest where text and buttons
sit; the photo shows through
above.

mapScrim

Black at 60%. The one value
behind every control drawn
over satellite imagery — day
chips, segment labels, map
buttons.

mapScrimGradient

Black 78% → clear, bottom →
top of the box it paints.
mapScrim's gradient sibling for
a *text block* overlaid on satellite
imagery (the Home continue-
trip hero) — painted on the text
block's own box plus a fade
band above, so coverage
scales with the user's text size.
Over-imagery layers stay black,
never teal.

appMapBackground

#0A0F1A. The space-dark
canvas behind map tiles
(`app_map.dart`).

The landing dark canvas

The signed-out landing page is the **one sanctioned exception** to the two Aegean canvases: it commits to a dark brand look in both theme modes, on the Aegean-night ladder's deepest rung. The exception ends at sign-in — no in-app surface may adopt this family. Tokens in `app_colors.dart` (the landing family).

landingCanvas
The Aegean-night ladder's deepest rung (#091620, `containerLowest`). The full-page field behind every landing section — the second permitted large brand field, after `brandGradient`.

landingHeroBlend
canvas 0% → 100%, top → bottom. A *dissolve* layer, third beside the two scrim: it ends the hero photo into the canvas. Never used to set text on a photo — that is still `heroScrim`'s job.

Glass & ink ladders
Fills are white at named strengths — card 6% · wellFaint 8% · field 10% · well 12% · hairline 14%; text and strokes take the ink ladder (disabled 35% · faint 60% · muted 70% · strong 85%). New landing surfaces pick a rung, never a fresh alpha.

Heritage gold

light gold #E8C452

dark gold #B98B1E

the mark's intercardinal points — never a UI color, never text, never a button

Semantic status

Two registers, deliberately separate: translucent *container pairs* for pills on cards, and solid brightness-aware *marks* for the uptime strip (alpha fills vanish at 3 px). "No data" has no token — it takes `outlineVariant` so absence can never read as a fourth severity.

Role	Token	Value	Sample
Positive / booked / published	<code>successContainer + onSuccessContainer</code>	green 15% · green-800 #2E7D32	
Attention / pending / draft	<code>warningContainer + onWarningContainer</code>	amber 20% · amber-900 #FF6F00	
Solid attention badge — small warning text (the alpha pair is below AA there) and chrome over imagery or teal fields	<code>warningSolid + onWarningSolid</code>	#FFB300 · black-87	
Solid neutral badge — same registers, no severity	<code>neutralSolid + onNeutralSolid</code>	#FFFFFF · brandDark	
Uptime marks — up	<code>upMark(brightness)</code>	light #43A047 · dark #66BB6A	
Uptime marks — degraded	<code>degradedMark(brightness)</code>	light #FFA000 · dark #FFCA28	
Uptime marks — down	<code>downMark(brightness)</code>	light #E53935 · dark #EF5350	

Planning-toolkit accents

One hue per tool, used small — home-screen tiles and map pins. Category accents: restaurant → deep orange, attraction → scheme primary, everything else → scheme secondary.

The two Aegean canvases — new in v1.6

Surfaces are no longer neutral, and they are no longer seed-derived. They come from the wind rose's own blue, authored as two ladders — `AppColors.aegeanNight` (dark) and `AppColors.aegeanPaper` (light) — selected by `AppColors.canvasFor(brightness)`, the one place a theme mode becomes a set of surfaces.

The hue is **205°**, between the mark's petrol blue (`markPetrol` #236684, 198°) and the rebrand's recorded Aegean-night canvas (209°). It is the blue the logo is drawn in, not a blue picked to go beside it. The neutrals it replaced were never neutral either: teal-seeded dark surfaces came out at `#0E1513`, a near-black with a green cast too weak to name. The idea is unchanged — surfaces carry the brand's hue quietly — only the hue is, and the chroma it is allowed.

aegeanNight · lowest **surface** · low #0F2738 · container **high #153851** · highest #1A4361 · bright
#091620 · **#0C1F2C** #123044 · **(cards)** #205479

aegeanPaper · lowest **surface** · low #EFF4F8 · container **high #E0EBF2** · highest
#FFFFFF · **#F6F9FB** #E7F0F5 · **(cards)** #D9E6EF

Inks: dark `onSurface` #E3E9ED / `onSurfaceVariant` #C0CBD3 ; light #101B23 / #364754 .
Hairlines: dark `outlineVariant` #405564 , light #BCC9D2 . Light input fields take **Paper Fill** `#F3F7F9` — cooled onto the canvas, because the old warm `#FAFAFA` read as a smudge once the fields around it went cool. Every tone is measured against both inks; the tightest pair in either canvas is **4.88 : 1**, and `app_theme_surfaces_test.dart` re-measures all sixteen rather than trusting the ladder.

Two hues, two jobs, no overlap. Teal still seeds every Material *role* — primary, secondary, error and their `on` pairs — so the action colour is untouched. Blue owns every *surface*. Teal is what you act *with*; blue is what you act *on top of*. A filled teal button is easier to find on Aegean night than it was on grey, which is the check that says the split is working.

Proportion

Cards sit a rung above their page on an authored ladder, **chrome included since v1.4**: the app bar is flat surface under a hairline in both themes, and the brand rides in the wordmark's ink (brandDark on light, scheme primary on dark), the rose, typography, and imagery. Teal as a fill is the primary action — the one filled button that matters on a screen. Gold belongs to the mark. Tool accents and status colors appear at chip-and-pin scale, never as fields. Both themes take their roles from the same `brand` seed; **dark mode is no longer the light build with brightness flipped** — the two canvases are composed separately, one design in two keys.

Superseded in v1.6: "Surfaces stay neutral — white cards on quiet ground, warm where the direction section leads" and "dark mode is the same build with brightness flipped." Both were true of a seed-derived scheme and are not true of an authored one. The **warm-plaster** direction on the market page above is likewise now cool plaster — the register (quiet ground, photography carries the heat) survives the temperature change; the swatches there do not.

Contrast, measured

Pair	Ratio	WCAG
brandDark #004D40 on white	9.83 : 1	AA
brandDark #004D40 on brandTint #E0F2F1	8.49 : 1	AA
teal-100 #B2DFDB on brandDark #004D40	6.78 : 1	AA
gold #E8C452 on brandDark #004D40	5.83 : 1	AA
brand #00796B on white (and reversed)	5.32 : 1	AA
success #2E7D32 on white	5.13 : 1	AA
brand #00796B on brandTint #E0F2F1	4.60 : 1	AA
black on warningSolid #FFB300	11.70 : 1	AA
white on brandLight #00897B (gradient start)	4.32 : 1	AA large
white on Aegean night #0C1F2C (the splash field, v1.7)	16.83 : 1	AAA
gold #E8C452 on brand #00796B	3.15 : 1	AA large / graphics
dark gold #B98B1E on white	3.10 : 1	graphics only
success #2E7D32 on its container	4.46 : 1	AA large — 0.04 short of AA
onWarning #FF6F00 on its container	2.52 : 1	review

Ratios computed against WCAG 2.x relative luminance; container rows use the alpha fill flattened onto white. The amber pair is the one open finding: fine for icon-weight accents, below AA for small text — prefer the solid pair, or darken toward brown, where small warning text matters.

Typography

Two faces, three jobs — declared once in `app_typography.dart` and bundled as subsetted TTFs. Never Google Fonts at runtime; production CSP blocks it.

Cormorant Garamond 600 — the wordmark

SemiBold 600, a static instance of the variable font. The wordmark, and only the wordmark. The face has a true lowercase, so "Anemos" is uppercased by the string to paint ANEMOS. The one weight baked into rasters (og-card, lockup).

ANEMOS

Cormorant Garamond 500 — headings

The wordmark's own family, one weight down, so headings and the brand sit in one register instead of two that have to be reconciled. It was Marcellus until August 2026 — picked for the *previous* (Cinzel) wordmark's register, and left mismatched when the wordmark moved. Every style naming the family must state its weight (w500 here, w600 for the wordmark), or the web synthesizes faux-bold. Sentence case, always.

Ten days across the
Cyclades

A B C D E F G H I J — a b c d e f g h i j — 0 1 2 3 4 5 6 7 8 9

Inter — everything else

Body, labels, buttons, and every number — including the big values in stat tiles, which opt out of the heading face on purpose. Weights 400 / 500 / 600 / 700. Below the headline line, hierarchy is weight, not size.

Regular 400 — Your itinerary is ready to review.

Medium 500 — 4 nights in Naxos · 2 travelers

SemiBold 600 — Flights from \$412 round trip

Bold 700 — Book by Friday

Scale			
Style	Face	Size / spacing	Where
Wordmark — auth	Cormorant Garamond 600	26 px · ls 1.5	Auth screen, under the 72 px mark
Wordmark — app bar	Cormorant Garamond 600	19 px · ls 1.0	Every app bar, in the wordmark ink (brandDark light / primary dark)
Wordmark — splash	Cormorant Garamond 600	22 px · ls 3.0	Boot splash, web shell and in-app (the tuned outlier)
headlineLarge	Cormorant Garamond 500	44 px · lh 1.2	Page-scale headings
headlineMedium	Cormorant Garamond 500	39 px · lh 1.2	Section heads
headlineSmall	Cormorant Garamond 500	34 px · lh 1.2	Card-scale heads
App-bar page title	Cormorant Garamond 500	28 px · ls 0.2	App bar, onSurface ink
Section heading (pinned)	Cormorant Garamond 500	28 px · lh 1.2	<code>AppTextStyles.sectionHeading</code> — city headers, trip header card
titleLarge / Medium / Small	Inter 700 / 600 / 600	M3 default sizes (22 / 16 / 14)	List titles, tiles, dialogs
body / label	Inter 400 · labels 600	M3 defaults (16 / 14 / 12)	Everything else

The headline sizes are an **optical correction, not a scale**: Cormorant Garamond's x-height is 0.386 em against Inter's 0.546, so equal point sizes read a size down. They are the sizes the previous display face used × **1.295** (`kDisplayOpticalScale`) — Marcellus's 0.500 em x-height over Cormorant's 0.386 — so every tier's lowercase lands where the design already had it and the face change is not a resize of the app. Caps run ~15% ahead of that match; sentence case is what these headings are, so the lowercase wins. Full parity with Inter would be 1.414, which the app has never been at.) Both weights are subsetting to Latin only: Greek strings (ἀνεμος) fall back to system faces by design.

Space, shape & elevation

Spacing

xs 4	
sm 8	
md 12	
lg 16	
xl 24	
xxl 32	

AppSpacing — the six stops. Buttons pad xl / md.
Touch targets never fall below **48 px**
(`kMinTouchTarget`).

Shadow

black 10 · blur 10 · y 3

hero
brandDark 40 · blur 16 · y 6 · photographic heroes
(the brandCard shadow retired with the gradient
cards, v1.4)

Light always from above — every shadow offsets
downward. Cards sit at elevation 3 with
transparent surface tint: separation is an explicit
color choice, never an implicit overlay.

Radius

sm 8
inputs,
badges

md 12
cards,
menus

lg 20
heroes; chips go
full-round

Imagery

Photography is the brand's warmth — real places in real light, never illustration, never stock-abstract. Text sits on photos only over a scrim.

The destination set (12 cities, `assets/images/destinations/`). Warm hour, saturated sea and stone, a human scale somewhere in frame. Every photo is credited — `CREDITS.md` sits beside the set and `LICENSES.md` beside the heroes; new photography joins those files or doesn't ship.

Rules of the frame. Place text over photography only with `heroScrim` (brand surfaces) or the `mapScrim` family (satellite imagery; `mapScrimGradient` for a text block) underneath. Cards crop photos at md radius; heroes at lg. Never tint a photo teal — the scrims are the only brand layers a photo carries, plus the one recorded `landingHeroBlend` dissolve, which ends the landing hero photo into the canvas and never sets text. Product screenshots ride on the real UI, not mockup chrome.

Plan less. Travel more.

Anemos speaks like a well-traveled friend with the map already open: plain, confident, second person, specific.

The register, in the strings we ship

Surface	Copy
Tagline	"Plan less. Travel more."
Hero subtitle	"Your AI travel companion — describe the trip you want and get a full day-by-day itinerary with routes, places, and flights."
Meta description	"Plan trips and build day-by-day itineraries with an AI travel assistant."
Agent persona	Ferdinand — knowledgeable, unhurried, cites locals by name when a recommendation is theirs.

Principles

Sentence case everywhere. Capitals belong to the wordmark and to one sanctioned display device — the letterspaced small-caps place eyebrow a destination surface may open with (the design-inspiration library's Amanzoe move); nothing else earns them. **Short sentences, concrete nouns.** Say "4 nights in Naxos," not "your accommodation window." **No exclamation inflation.** The product's confidence is quiet; one period does the work. **Credit real people.** Local recommendations carry their source's name — attribution is a feature, not a footnote.
